INCIDENT LIFE CYCLE AUTOMATION

Solution Requirements

Functional and quality requirements for Incident Life Cycle Automation

STUDENT NAME **Shanmugapriya M**	PROJECT **Incident Life Cycle Automation**
DOCUMENT DATE **08 October 2026**	SCOPE **Incident lifecycle workflow & automation only**

1. Functional Requirements

No.	Area	Requirement
FR-01	Incident Intake	Create an incident with title, description, source, category, impact, urgency and timestamp.
FR-02	Identification	Generate a unique incident ID and initialize the lifecycle state.
FR-03	Priority	Determine or capture priority using impact/urgency and configured rules.
FR-04	Assignment	Route an incident to the appropriate queue or owner and record the change.
FR-05	SLA Tracking	Start the applicable SLA timer and expose due / risk state.
FR-06	Escalation	Trigger an escalation when defined SLA conditions are reached.
FR-07	Investigation	Allow authorized users to add work notes and status updates.
FR-08	Resolution	Record resolution details and resolution time before moving to Resolved.
FR-09	Closure	Complete the final closure action while retaining the lifecycle record.
FR-10	History	Maintain chronological status, owner, priority and action history.

FR-11	Search & Dashboard	View and filter incidents by useful operational fields.
FR-12	Role Access	Limit actions according to the user's role.
FR-13	Auditability	Record important changes with actor, action and timestamp.

2. Non-Functional Requirements

No.	Quality	Requirement
NFR-01	Usability	Common incident actions should be understandable with minimal training.
NFR-02	Security	Authenticated access, role checks and secure session handling should be used.
NFR-03	Reliability	Successful lifecycle updates should remain consistent with their history.
NFR-04	Performance	Common incident views and actions should remain responsive under expected project load.
NFR-05	Maintainability	Lifecycle rules should be organized so priority, routing and SLA logic can be updated.
NFR-06	Auditability	Important lifecycle transitions should be traceable by user, time and action.
