INCIDENT LIFE CYCLE AUTOMATION

Performance Testing Plan & Report

Focused checks for responsiveness of the incident automation workflow

STUDENT NAME **Shanmugapriya M**	PROJECT **Incident Life Cycle Automation**
DOCUMENT DATE **08 October 2026**	SCOPE **Incident lifecycle workflow & automation only**

1. Test Objectives

- Check response time for common incident actions.
- Ensure scheduled SLA checks do not unnecessarily block user-facing operations.
- Confirm incident search and filtering remain usable as records increase.
- Capture actual measurements instead of inventing benchmark results.

ID	Scenario	Input	Measure	Expected
PT-01	Create incident	Submit a valid incident	End-to-end response + successful creation	Acceptable interactive response
PT-02	Open incident	Load incident and lifecycle history	Read response time	Stable response for normal history
PT-03	Search & filter	Filter by status, priority, owner and date	Query latency	Predictable response
PT-04	SLA background check	Process due / at-risk incidents	Job duration + UI impact	No material blocking
PT-05	Concurrent updates	Multiple users update incidents	Errors + throughput	No unexpected failures

2. Execution Record

Test ID	Environment	Observed Result	Status	Notes
PT-01	Project test environment	To be recorded during execution	Pending	Use measured evidence
PT-02	Project test	To be recorded	Pending	Use measured

	environment	during execution		evidence
PT-03	Project test environment	To be recorded during execution	Pending	Use measured evidence
PT-04	Project test environment	To be recorded during execution	Pending	Use measured evidence
PT-05	Project test environment	To be recorded during execution	Pending	Use measured evidence

3. Acceptance Guidance

Final submission should replace pending entries with actual measurements from the implemented system.
