INCIDENT LIFE CYCLE AUTOMATION

Empathy Map Canvas

Understanding the people involved in reporting, managing and resolving incidents

STUDENT NAME **Shanmugapriya M**	PROJECT **Incident Life Cycle Automation**
DOCUMENT DATE **08 October 2026**	SCOPE **Incident lifecycle workflow & automation only**

1. Target Users

The project serves people who report incidents, handle assigned work, supervise incident flow and review lifecycle history.

Dimension	Project Insight
SAYS	“I need to report the issue quickly.” • “Who owns my incident?” • “Is the response still within SLA?”
THINKS	The issue may affect normal work. Missing updates can delay decisions. Status information should be trustworthy.
DOES	Reports an incident, checks status, adds investigation updates, reassigns work when authorized and confirms resolution.
FEELS	Uncertain when ownership is unclear; pressured when SLA risk grows; confident when the lifecycle is visible.

2. Pains

- Incident details may arrive incomplete or inconsistently.
- Manual ownership hand-offs can slow the first response.
- SLA risk can be identified too late without automatic monitoring.
- Lifecycle history can become fragmented across separate updates.

3. Gains

- One place to create and follow an incident.
- Clear ownership and current status.

- Automatic SLA monitoring and escalation.
- A chronological, audit-ready history from creation to closure.

4. Design Insight

The system should make the next lifecycle action explicit, reduce avoidable manual follow-up and preserve evidence of every important transition.
