INCIDENT LIFE CYCLE AUTOMATION

# Define Problem Statements

Turning lifecycle pain points into clear, solution-neutral problem statements

| DOCUMENT DATE<br>**08 October 2026** | SCOPE<br>**Incident lifecycle workflow & automation only** |

## 1. Problem Statements

| ID | I am | I am trying to | But | Because | Which makes me feel |
|---|---|---|---|---|---|
| PS-01 | Reporter / End User | raise an incident and understand what happens next | ownership and status can depend on manual follow-up | intake and progress visibility are not consistently automated | uncertain about response |
| PS-02 | Support Engineer | resolve assigned incidents within the required time | priority, ownership and updates can be fragmented | coordination is partly manual | slowed down during investigation |
| PS-03 | Incident Manager | control incident flow before SLA breach | escalation may happen late | monitoring and alerts are not always automatic | operational risk is harder to control |
| PS-04 | Administrator / Reviewer | verify the complete history of an incident | important evidence can be spread across updates | lifecycle events are not captured in one trail | review takes unnecessary effort |

## 2. Core Problem

Incident handling can become a sequence of disconnected manual activities instead of one traceable, rule-driven lifecycle from intake to closure.

## 3. Design Direction

Automate only the lifecycle activities that directly reduce hand-off delay, missed SLA actions and missing history.
